If ye are looking at the source code of the page, ew can see "admin.php", so we access http://<IP>:<PORT>/admin.php. Now, if we inspect again, we can see the message " You are not a local! ". We can use "curl" in the following situation :
        curl -H "X-Forwarded-For: 127.0.0.1" http://34.107.35.6:31926/admin.php

Explication :
        - "-H" -> Add a custom header (e.g. User-Agent, Cookie, X-Forwarded-For)
        - "X-Forwarded-For: 127.0.0.1" -> You access with a fake IP (localhost spoof).
        #We can deduct the possible command from the first image

THE FLAG :
